COGGS Hit + Auto BY Daedal.

Games rot.

COGGS Hit upgrades the engine. COGGS Auto plays the game to prove it still works.

The engine moves on. *The game goes black.*

Quick_3D_RPG · three.js r118 → r162 · version bump only, 13 files
Failed to resolve module specifier "three"
0 of 4 frames draw a 3D world

THE GAP

No tool in games does this today. Code reviewers read the diff; QA bots play the build; nobody upgrades the engine and proves the game still plays the same.

ALREADY PAID FOR

Modules of this already run as LiveOps PoCs at major game companies with 10M+ players, including Nexon and Krafton, at $11.5K–$19.2K a month.

Founder statement, 2026-11-09: KRW 15-25M a month, at the pegged 1,300 KRW per USD.

Hit writes the fix. *Auto plays it and judges it.*

COGGS HIT · WRITES CODE

Keeps the game alive

Opens the upgrade pull request, reads why Auto failed it, and pushes one fix per cause, each with its evidence and source.

COGGS AUTO · NEVER WRITES CODE

Plays your game

Replays the base and the pull request with the same seed, inputs and renderer, compares the frames and posts the verdict.

Issue → Hit opens PR → Auto plays base + PR → Ping posts verdict → FAIL: Hit pushes fix → PASS: merge

Auto never writes game code. Hit never touches the verdict. Each works alone.

Three fixes, *one PASS*

BUMP ONLY

Black

FAIL

No 3D frame, one page error

FIX 1 · RENAMES, GLSL3

68.20–75.59%

FAIL

of pixels differ from r118

FIX 2 · COLOR, LIGHTS

7.58–24.87%

FAIL

Red = differs. Only the FBX models are off

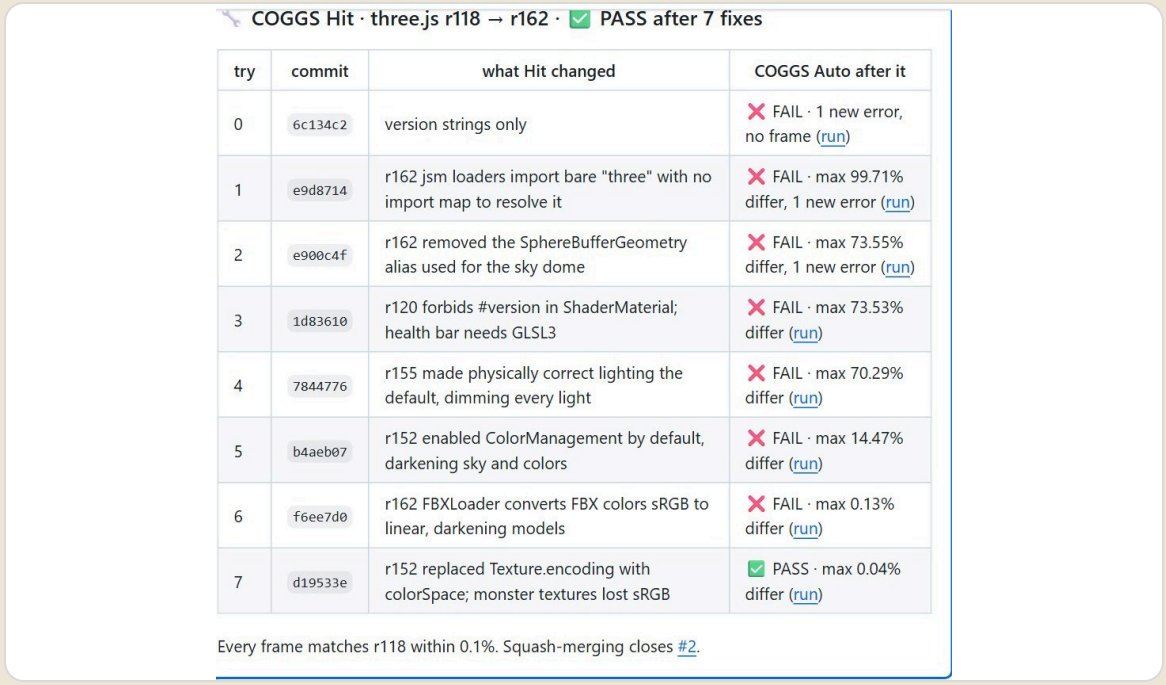

FIX 3 · FBXLOADER COLORS

0.0202–0.0393%

PASS

Every checked frame under the limit

Daedal Ping posts the verdict *on the PR*

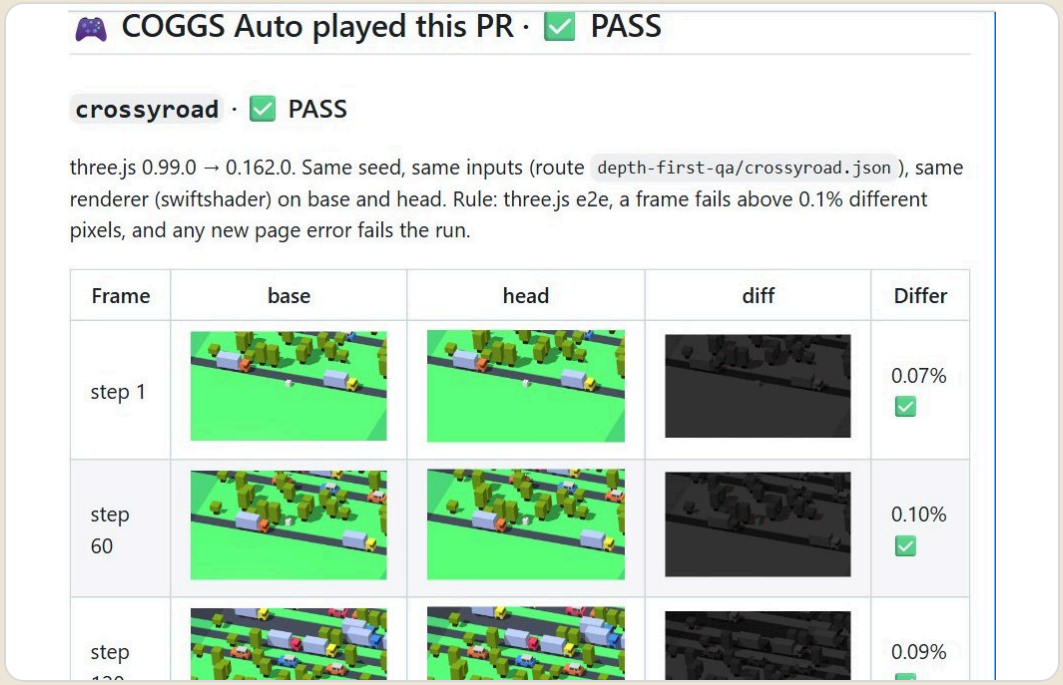

COGGS Hit · three.js r118 → r162 · ✅ PASS after 7 fixes

try	commit	what Hit changed	COGGS Auto after it
0	`6c134c2`	version strings only	❌ FAIL · 1 new error, no frame (run)
1	`e9d8714`	r162 jsm loaders import bare "three" with no import map to resolve it	❌ FAIL · max 99.71% differ, 1 new error (run)
2	`e900c4f`	r162 removed the SphereBufferGeometry alias used for the sky dome	❌ FAIL · max 73.55% differ, 1 new error (run)
3	`1d83610`	r120 forbids #version in ShaderMaterial; health bar needs GLSL3	❌ FAIL · max 73.53% differ (run)
4	`7844776`	r155 made physically correct lighting the default, dimming every light	❌ FAIL · max 70.29% differ (run)
5	`b4aeb07`	r152 enabled ColorManagement by default, darkening sky and colors	❌ FAIL · max 14.47% differ (run)
6	`f6ee7d0`	r162 FBXLoader converts FBX colors sRGB to linear, darkening models	❌ FAIL · max 0.13% differ (run)
7	`d19533e`	r152 replaced Texture.encoding with colorSpace; monster textures lost sRGB	✅ PASS · max 0.04% differ (run)

Every frame matches r118 within 0.1%. Squash-merging closes #2.

PR #3 · COGGS Hit · one fix per cause, 7 fixes

COGGS Auto played this PR · ✅ PASS

`crossyroad` · ✅ PASS

three.js 0.99.0 → 0.162.0. Same seed, same inputs (route `depth-first-qa/crossyroad.json`), same renderer (swiftshader) on base and head. Rule: three.js e2e, a frame fails above 0.1% different pixels, and any new page error fails the run.

Frame	base	head	diff	Differ
step 1				0.07% ✅
step 60				0.10% ✅
step				0.09%

PR #5 · daedal-ping[bot] · COGGS Auto verdict

PR #3 · QUICK 3D RPG · R118 → R162

PASS after 7 fixes

0.01–0.04% of pixels differ. Merged today, closing issue #2.

PR #5 · CROSSY ROAD · R99 → R162

PASS after 4 fixes

0.07–0.10% of pixels differ. Merged today, closing issue #4.

PR #3 · REVIEW VS PLAY

73.53% differ

Code review guessed "darker" at 6/10 confidence. Auto played it and failed it.

A harness takes a week. *These compound.*

DETERMINISTIC REPLAY

0 px

Same build played twice: zero pixels change. Seeded randomness, frozen clock, one input route.

GBRAIN LESSON MEMORY

92.83% → 0.12%

On game 2, Hit's brain returned game 1's color lesson before fix 3. That fix took Crossy Road from 92.83% to 0.12% of pixels.

GAME-DOMAIN ONTOLOGY

Daedal Games reads the game

Each failing frame maps to engine parts (renderer, loaders, input) and the probes that catch them.

We sell the fix. *The play is free.*

FREE	HOBBY	PRO	HEAVY	STUDIO	LIVEOPS
$0	$79 /mo	$249 /mo	$499 /mo	$5,000 /mo	$15,000
3 fixes once, public repos, unlimited Auto plays	5 fixes a month, 1 private repo	15 fixes, Hit watches engine releases	25 fixes, 10 repos	From $5,000 a month, billed yearly	Per live title per month

LiveOps is anchored to what Nexon and Krafton PoCs pay today: $11.5K–$19.2K a month. Auto runs in the customer's own GitHub Actions, free on public repos.

Founder statement 2026-11-09, KRW 15-25M at 1,300 KRW per USD · docs/BM.md

Built on *gstack* and *gbrain*

GSTACK · GARRYTAN/GSTACK, MIT

The review lens

`/review` reads every upgrade PR, run by `tools/review.mjs`

`office-hours` and `plan-ceo-review` gave the YC-partner lens for daedal-games:partner-grill

That grill produced `docs/PITCH-QA.md`

GBRAIN · GARRYTAN/GBRAIN, MIT

Hit's memory

Every solved upgrade cause becomes a lesson, queried before every fix (`tools/brain.mjs`)

Game 2 read game 1's lessons before its first fix

The prices came from LilMSkills pricing-pick and pricing-sim on 17 saved price pages: `docs/BM.md`

CodeRabbit reads your code. COGGS Auto *plays your game.* COGGS Hit keeps it alive.

Questions.

11 answers, one per slide, each from a measurement or the founder's statement.

Your PASS checks only 4 frames?

We checked every second step, 1 to 180. The final fix passes 89 of 91 frames. The 2 misses are steps 6 and 8, right after the game loads.

wow-video diffs.json heads.vfix3: f006 0.33%, f008 0.14%; the 4 steps were committed before Hit opened its PR

Who pays today?

Major studios with over ten million players run parts of this as LiveOps pilots, Nexon and Krafton among them, at fifteen to twenty-five million won a month.

Founder statement, 2026-11-09 · $11.5K-$19.2K at 1,300 KRW per USD

Engine upgrades are rare. Why a subscription?

Hit watches every engine release and store deadline. Quick 3D RPG is 44 three.js releases behind, Crossy Road was 63. Firebase Test Lab shuts down in September 2027.

Issues #2 and #4 · firebase.google.com Test Lab usage page

Did Hit do it, or did you?

Hit opened the issues and the pull requests on its own. Every try is a line in its log, and every fix must name its cause and its source, or Hit refuses it.

hit/out/3.jsonl, hit/out/5.jsonl

What does Auto catch that code review misses?

On PR #3, code review read the diff and guessed the lights look darker, at 6 of 10 confidence. Auto played it: 73.53% of pixels differ.

PR #3 comments: gstack /review + open-code-review, and COGGS Auto

Can Hit cheat the test?

No. Hit may edit only the game folder. A change to the route, the limit or the judge is refused.

Refused paths: .coggs/, auto/, hit/, tools/, brain/, the workflow

What breaks first on a new game?

The route file, about 30 lines per game. On Crossy Road the bump drew no canvas: THREE is not defined. Auto failed it before anyone merged.

Is the brain memory, or your answer key?

It is memory. On game 2, the brain returned game 1's color lesson before fix 3. That fix took the diff from 92.83% to 0.12%.

hit/out/5.jsonl: brain hit three-r152-color-management-legacy-lights, then fix 3

What can't a studio rebuild by Friday?

The harness, yes. The lesson brain, the game-domain ontology and the frame history grow with every pull request we play.

How did you build it?

With two open tools by Garry Tan. gstack's /review reads every upgrade pull request through tools/review.mjs, and its office-hours and plan-ceo-review gave the YC-partner lens our partner-grill used to write the pitch Q&A. gbrain is Hit's memory: every solved cause is a lesson, queried before every fix. Our prices came from pricing-pick and pricing-sim on 17 saved price pages.

Why is the agent called Ping?

In games you ping a spot to call your team. Ping is also network lag, the number every player blames. And it sounds like pink, our brand color.
